Data Engineering Project

Automating ELT Data Pipeline with Cloud Run Functions

Extract, Load, & transform 1 Million Health Records

Date: 19-01-2025

Table of Contents

Chisom Nnamani

First of, a Recap

ASPECT	ETL	ELT
Transformation	Performed before loading	Performed after loading
Where it happens	External tools (e.g Dataflow, Dataprep)	Inside the data warehouse (e.g Bigquery, SQLServer)
Scalability	Limited by the ETL Tools Capabilities	Highly scalable with BigQuery processing power
Use Cases	Legcay systems, Data governance requiements	Cloud-native analytics, large datasets

Positioning the Project: An ELT Data Pipeline

Chisom Nnamani

Project Requirements

The Medical Research Team receives a global health statistics data file containing disease data for all countries.

Each country's Health Minister should have access only to their respective country's medical data. Additionally, they need the ability to analyze diseases for which no treatment or vaccination is currently available.

Challenges

- The data is currently provided as a single file containing over 1 million records for all countries.
- due to the confidential nature of the data, sharing the entire file with everyone is not feasible.
- analyzing such a CSV file to extract meaningful insights is complex and inefficient.

Objective

Develop a robust data analytics solution to securely manage and filter this data securely, ensuring restricted and enabling efficient analysis of diseases without available treatment or vaccination.

Conclusion

This end-to-end ELT data pipeline project on a global scale will help in:

- Healthcare Policy Analysis: Understanding which diseases are most prevalent and which countries require more investment in healthcare infrastructure.
- Epidemiological Studies: Studying the correlation between disease prevalence and socio-economic factors like income, education, and urbanization.
- Machine Learning Models: Training predictive models to forecast disease trends, mortality rates, and treatment effectiveness based on historical data.
- Global Health Research: Identifying regions that need targeted interventions or public health campaigns.
